ZCS Single Server Installation

The Zimbra Collaboration Server (ZCS) includes the Zimbra MTA, the Zimbra LDAP server, and the Zimbra mailbox server. In a single-server installation, all components are installed on one server and require no additional manual configuration.

This installation guide is a quick start guide that describes the basic steps needed to install and configure the Zimbra Collaboration Server in a direct network connect environment. In this environment, the Zimbra server is assigned a domain for which it receives mail, and a direct network connection to the Internet. When the Zimbra Collaboration Server is installed, you will be able to log on to the Zimbra administration console to manage the domain and provision accounts. The accounts you create will be able to send and receive external email.

Topics in this chapter include:

- Important Notice About Single Server Installations
- Installation Prerequisites
- Modifying Operating System Configurations
- Configure DNS
- Overview of Installation Process
- Downloading the Zimbra Software
- Basic Configuration
- Installing Zimbra Software
- Provisioning Accounts
- Support and Contact Information

Important Notice About Single Server Installations

The Zimbra Collaboration Server is designed to be the only application suite installed on the server. The Zimbra Collaboration Server bundles and installs, as part of the installation process various other third party and open source software, including Apache Jetty, Postfix, OpenLDAP®, and MySQL®. The versions installed have been tested and configured to work with the Zimbra software. See the Administration Guide for a complete list of software.
The following table shows the default port settings when the Zimbra Collaboration Server is installed.

### Table Zimbra Port Mapping

<table>
<thead>
<tr>
<th>Service</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Queue Manager</td>
<td>22</td>

<tr>
<td>Mailboxd IMAP SSL</td>
<td>993</td>
</tr>
<tr>
<td>Mailboxd POP SSL</td>
<td>995</td>
</tr>
<tr>
<td>Mailboxd LMTP</td>
<td>7025</td>
</tr>
</tbody>
</table>

**Important:** You cannot have any other web server, database, LDAP, or MTA server running, when you install the Zimbra software. If you have installed any of the applications before you install Zimbra software, disable these applications. During the ZCS install, Zimbra makes global system changes that may break applications that are on your server.

### Installation Prerequisites

In order to successfully install and run the Zimbra Collaboration Server, ensure your system meets the requirements described in this section. System administrators should be familiar with installing and managing email systems.

### System Requirements

For the ZCS system requirements see Other Dependencies in the System Requirements table.

**Note:** To find SSH client software, go to Download.com at http://www.download.com/ and search for SSH. The list displays software that can be purchased or downloaded for free. An example of a free SSH client software is PuTTY, a software implementation of SSH for Win32 and Unix platforms. To download a copy go to http://putty.nl
Modifying Operating System Configurations

The Zimbra Collaboration Server runs on one of several operating systems, including Ubuntu® LTS, Red Hat® Enterprise Linux, and SUSE® Linux Enterprise.

Configuration modifications for frequently used operating systems are described in individual configuration documents. Other operating systems may require similar modifications, and you can use the information contained in the individual configuration documents as a reference to gauge whether your operating system may need to be modified.

A full default installation of the Linux distribution that you select is required.

For more information, refer to the System Requirements document for information on hardware and software configurations supported by Zimbra Collaboration Server.

Note: Zimbra recommends that the operating systems you use are updated with the latest patches that have been tested with ZCS. See the latest release notes to see the operating systems patch list that has been tested with ZCS.

Configure DNS

In order to send and receive email, the Zimbra MTA must be configured in DNS with both A and MX records. For sending mail, the MTA uses DNS to resolve hostnames and email-routing information. To receive mail, the MX record must be configured correctly to route the message to the mail server.

During the installation process, ZCS checks to see if you have an MX record correctly configured. If it is not, an error is displayed suggesting that the domain name have an MX record configured in DNS.

You must configure a relay host if you do not enable DNS. After ZCS is installed, go to the Global Settings>MTA tab on the administration console and uncheck Enable DNS lookups. Enter the relay MTA address to use for external delivery.

Note: Even if a relay host is configured, an MX record is still required if the ZCS server is going to receive email from the Internet.

Overview of Installation Process

When you run the install script, the Zimbra install verifies that the correct prerequisite packages are available to be installed.

- Zimbra Core installs the libraries, utilities, and monitoring tools.
**Zimbra LDAP** installs the OpenLDAP software, which provides open source LDAP directory services.

**Zimbra Store** installs the mailbox server, including Jetty, the servlet container for the Zimbra server.

**Zimbra MTA** installs the Postfix open source MTA, the Clam AntiVirus antivirus engine, the SpamAssassin junk mail filter, and the Amavisd-New content filter.

**Zimbra SNMP** installs the SNMP package for monitoring. This package is optional.

**Zimbra Logger** installs tools for syslog aggregation and reporting. If you do not install Logger the server statistics are not captured, and the server statistics section of the administration console does not display.

**Zimbra Spell** installs the Aspell open source spelling checker.

**Zimbra Apache** is installed automatically when Zimbra Spell is installed.

The Zimbra server configuration is menu driven. The installation menu shows you the default configuration values. The menu displays the logical host name and email domain name [mailhost.example.com] as configured on the computer. You can change any of the values. For single server installs, you must define the administrator’s password, which you use to log on to the administration console.

**Downloading the Zimbra Software**

For the latest Zimbra software download, go to [www.zimbra.com](http://www.zimbra.com). Save the Zimbra Collaboration Server archive file to the computer from which you will install the software.

Zimbra Sales by contacting sales@zimbra.com or calling 1-650-427-5701.

**Basic Configuration**

The default configuration installs the Zimbra-LDAP, the Zimbra-MTA with anti-virus and anti-spam protection, the Zimbra mailbox server, the SNMP monitoring tools (optional), Zimbra-spell (optional), the logger tool (optional), on one server.

The menu driven installation displays the components and their existing default values. You can modify the information during the installation process.

The table below describes the menu options:

<table>
<thead>
<tr>
<th>Main Menu</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) <strong>Common Configuration</strong> - These are common settings for all servers</td>
<td></td>
</tr>
<tr>
<td>Main Menu</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Hostname</td>
<td>The host name configured in the operating system installation</td>
</tr>
<tr>
<td>LDAP master host</td>
<td>The LDAP host name. On a single server installation, this name is the same as the hostname.</td>
</tr>
<tr>
<td>LDAP port</td>
<td>The default port is 389</td>
</tr>
<tr>
<td>LDAP Admin password</td>
<td>This is the master LDAP password.</td>
</tr>
<tr>
<td>Secure interprocess communications</td>
<td>The default is YES. Secure interprocess communications requires that connections between the mail store, and other processes that use Java, use secure communications. It also specifies whether secure communications should be used between the master LDAP server and the replica LDAP servers for replication.</td>
</tr>
<tr>
<td>Time Zone</td>
<td>Select the time zone to apply to the default COS. The time zone that should be entered is the time zone that the majority of users in the COS will be located in. The default time zone is PST (Pacific Time).</td>
</tr>
<tr>
<td>2) zimbra-ldap</td>
<td></td>
</tr>
<tr>
<td>Status</td>
<td>The default is Enabled. For replica LDAP servers, the status can be changed to Disabled if the database is manually loaded after installation completes.</td>
</tr>
<tr>
<td>Create Domain</td>
<td>You can create one domain during installation. Additional domains can be created from the administration console.</td>
</tr>
<tr>
<td>Domain to create</td>
<td>The default domain is the fully qualified hostname of the server. If you created a valid mail domain on your DNS server, enter it now. In most cases, you will accept the default.</td>
</tr>
<tr>
<td>LDAP Root password</td>
<td>The root LDAP password for internal LDAP operations.</td>
</tr>
<tr>
<td>LDAP Replication password</td>
<td>This is the password used by the LDAP replication user to identify itself to the LDAP master and must be the same as the password on the LDAP master server.</td>
</tr>
</tbody>
</table>
### Table Main Menu Options

<table>
<thead>
<tr>
<th>Main Menu</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>LDAP Postfix password</strong></td>
<td>This is the password used by the postfix user to identify itself to the LDAP server and must be configured on the MTA server to be the same as the password on the LDAP master server.</td>
</tr>
<tr>
<td><strong>LDAP Amavis password</strong></td>
<td>This is the password used by the amavis user to identify itself to the LDAP server and must be configured on the MTA server to be the same as the password on the LDAP server.</td>
</tr>
<tr>
<td><strong>3) zimbra-store</strong></td>
<td></td>
</tr>
<tr>
<td>Create Admin User</td>
<td>The administrator account is created during installation. This account is the first account provisioned on the Zimbra server and allows you to log on to the administration console.</td>
</tr>
<tr>
<td>Admin user to create</td>
<td>The default is admin@[mailhost.example.com].</td>
</tr>
<tr>
<td>Admin Password</td>
<td>You must set the admin account password. The password is case sensitive and must be a minimum of six characters. The administrator name, mail address, and password are required to log in to the administration console.</td>
</tr>
<tr>
<td>Anti-virus quarantine user</td>
<td>A virus quarantine account is automatically created during installation. When AmivisD identifies an email message with a virus, the email is automatically sent to this mailbox. The virus quarantine mailbox is configured to delete messages older than 7 days.</td>
</tr>
<tr>
<td>Enable automated spam training</td>
<td>By default, the automated spam training filter is enabled and two mail accounts are created.</td>
</tr>
<tr>
<td></td>
<td>1. <strong>Spam Training User</strong> to receive mail notification about mail that was not marked as junk, but should have been.</td>
</tr>
<tr>
<td></td>
<td>2. <strong>Non-spam (HAM) Training User</strong> to receive mail notification about mail that was marked as junk, but should not have been.</td>
</tr>
<tr>
<td></td>
<td>These addresses are automatically configured to work with the spam training filter. The accounts created have a randomly selected name. To recognize what the account is used for, you may want to change this name.</td>
</tr>
</tbody>
</table>
The default port configurations are shown

- **SMTP host**
- **Web server HTTP port**: 80
- **Web server HTTPS port**: 443
- **Web server mode** — Can be HTTP, HTTPS, Mixed, Both or Redirect.
  - **Mixed** mode uses HTTPS for logging in and HTTP for normal session traffic
  - **Both** mode means that an HTTP session stays HTTP, including during the login phase, and an HTTPS session remains HTTPS throughout, including the login phase.
  - **Redirect** mode redirects any users connecting via HTTP to an HTTPS connection.

All modes use SSL encryption for back-end administrative traffic.

- **IMAP server port**: 143
- **IMAP server SSL port**: 993
- **POP server port**: 110
- **POP server SSL port**: 995
- **Use spell checker server**, default **Yes** (if installed)
- **Spell server URL**: http://<example.com>:7780/aspell.php

<table>

### Table Main Menu Options

<table>
<thead>
<tr>
<th>Main Menu</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <strong>Enable version update checks.</strong> ZCS</td>
<td>automatically checks to see if a new ZCS update is available. The default is TRUE.</td>
</tr>
<tr>
<td>• <strong>Enable version update notifications.</strong></td>
<td>This enables automatic notification when updates are available when this is set to TRUE.</td>
</tr>
<tr>
<td>• <strong>Version update notification email.</strong></td>
<td>This is the email address of the account to be notified when updates are available. The default is to send the notification to the admin’s account.</td>
</tr>
<tr>
<td>• <strong>Version update source email.</strong></td>
<td>This is the email address of the account that sends the email notification. The default is the admin’s account.</td>
</tr>
</tbody>
</table>

**Note:** The software update information can be viewed from the Administration Console Tools Overview pane.
### Table Main Menu Options

<table>
<thead>
<tr>
<th>Main Menu</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4) zimbra-mta</td>
<td></td>
</tr>
<tr>
<td>• MTA Auth host — This is configured automatically if the MTA authentication server host is on the same server, but must be configured if the authentication server is not on the MTA.</td>
<td></td>
</tr>
<tr>
<td>• Enable Spamassassin — Default is enabled.</td>
<td></td>
</tr>
<tr>
<td>• Enable ClamAV — Default is enabled.</td>
<td></td>
</tr>
<tr>
<td>• Notification address for AV alerts — Sets the notification address for AV alerts. You can either accept the default or create a new address. If you create a new address, remember to provision this address from the admin console.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** *If the virus notification address does not exist and your host name is the same as the domain name on the Zimbra server, the virus notifications queue in the Zimbra MTA server cannot be delivered.*

• Bind password for Postfix LDAP user. Automatically set. This is the password used by the postfix user to identify itself to the LDAP server and must be configured on the MTA server to be the same as the password on the LDAP master server.

• Bind password for Amavis LDAP user. Automatically set. This is the password used by the amavis user to identify itself to the LDAP server and must be configured on the MTA server to be the same as the password on the LDAP server.

5) zimbra-snmp (optional)

</tbody>
</table>
Installing Zimbra Software

**Important:** Before you begin, make sure to:

- Confirm you have the latest system requirements and prerequisites for installing ZCS, as described in [System Requirements for Zimbra Collaboration Server 7.2](#) on page 29.

Open an SSH session to the Zimbra server and follow the steps below.

1. Log in as `root` to the Zimbra server and `cd` to the directory where the Zimbra Collaboration Server archive tar file is saved (`cd /var/<tmp>`). Type the following commands:
   
   ```
   • tar xzvf [zcsfullfilename.tgz], to unpack the file.
   • cd [zcsfullfilename] to change to the correct directory.
   • ./install.sh to begin the installation.
   ```
The `install.sh` script reviews the installation software to verify that the Zimbra packages are available.

```
[root@mailhost tmp]# tar xzvf zcs.tgz
zcs-NETWORK-7.2.0_GA_3107.UBUNTU10_64.20100916012803/
zcs-NETWORK-7.27.0_GA_3107.UBUNTU10_64.20100916012803/packages/

```

Screenshots in this guide are examples of the Zimbra installation script. The actual script may be different.

2. The installation process checks to see if Sendmail, Postfix, and MySQL software are running. If any of these applications are running, you are asked to disable them. Disabling MySQL is optional but highly recommended. Sendmail and Postfix must be disabled for the Zimbra Collaboration Server to start correctly.

3. Next, the installer checks to see that the prerequisite software is installed. If the prerequisite software packages are not installed, the installation process stops. You must fix the problem and start the installation over. See Other Dependencies in System Requirements for Zimbra Collaboration Server 7.2.
Select the services to be installed on this server. To install Zimbra Collaboration Server on a single server, enter Y for the ldap, logger, mta, snmp, store, and spell packages. The installer verifies that there is enough room to install ZCS. If there is not, the installation stops.
4. Next, type **Y** and press **Enter** to modify the system.

- Selected packages are installed on the server.
- Checks to see if MX record is configured in DNS. The installer checks to see if the hostname is resolvable via DNS. If there is an error, the installer asks if you would like to change the hostname. We recommend that the domain name have an MX record configured in DNS.
- Checks for port conflict.
5. At this point, the **Main menu** displays showing the default entries for the Zimbra component you are installing. To expand the menu to see the configuration values, type **X** and press **Enter**. The Main menu expands to display configuration details for the package being installed. Values that require further configuration are marked with asterisks (****) to their left.

To navigate the Main menu, select the menu item to change. You can modify any of the defaults. See Table Table, “Main Menu Options,” on page 8, for a description of the Main menu.

For a quick installation, accepting all the defaults, you only need to do the following:

6. If your time zone is not Pacific time, enter **1** to select **Main menu 1, Common Configuration and then enter 6 for TimeZone**. Set the correct time zone.
### Main menu

1) Common Configuration:
   - Hostname: mailhost.example.com
   - Ldap master host: mailhost.example.com
   - Ldap port: 389
   - Ldap Admin password: set
   - Secure interprocess communications: yes
   - TimeZone: America/Los_Angeles

2) zimbra-ldap:
   - Status: Enabled
   - Create Domain: yes
   - Domain to create: mailhost.example.com
   - Ldap root password: set
   - Ldap replication password: set
   - Ldap postfix password: set
   - Ldap amavis password: set
   - Ldap nginx password: set

3) zimbra-store:
   - Status: Enabled
   - Create Admin User: yes
   - Admin user to create: admin@mailhost.example.com
   - Admin Password: UNSET
   - Anti-virus quarantine user: virus-quarantine.zodi72xmm6@mailhost.example.com
   - Enable automated spam training: yes
   - Spam training user: spam.vviwu_izoj@mailhost.example.com
   - Non-spam(Ham) training user: ham.unsbogyzer@mailhost.example.com
   - SMTP host: mailhost.example.com
   - Web server HTTP port: 80
   - Web server HTTPS port: 443
   - Web server mode: http
   - IMAP server port: 143
   - IMAP server SSL port: 993
   - POP server port: 110
   - POP server SSL port: 995
   - Use spell check server: yes
   - Spell server URL: http://mailhost.example.com:7780/aspell.php

4) zimbra-mta: Enabled
5) zimbra-snmp: Enabled
6) zimbra-logger: Enabled
7) zimbra-spell: Enabled
8) zimbra-convertd: Enabled
9) Default Class of Service Configuration:
10) Enable default backup schedule: yes
    c) Collapse menu
    r) Start servers after configuration yes
    s) Save config to file
    q) Quit
7. Type r to return to the Main menu.

8. Enter 3 to select zimbra-store from the Main menu. The Store configuration menu displays.

9. Select the following from the store configuration menu:
   - Type 4 and type the admin password. The password must be six or more characters. Press Enter.
   - Enable version update checks and Enable version update notifications are set to TRUE. ZCS automatically checks for the latest ZCS software updates and notifies the account that is configured in Version update notification email. You can modify this later from the administration console.

   Store configuration
   
   1) Status:               Enabled
   2) Create Admin User:    yes
   3) Admin user to create: admin@mailhost.example.com
   ** 4) Admin Password                           UNSET
   5) Anti-virus quarantine user: virus-quarantine.zodi72xmm6@mailhost.example.com
   6) Enable automated spam training:        yes
   7) Spam training user: spam.vviwu_izoj@mailhost.example.com
   8) Non-spam(Ham) training user: ham.unsbogyzer@mailhost.example.com
   9) SMTP host:                             mailhost.example.com
   10) Web server HTTP port:                80
   11) Web server HTTPS port:               443
   12) Web server mode:                      http
   13) IMAP server port:                    143
   14) IMAP server SSL port:                993
   15) POP server port:                     110
   16) POP server SSL port:                 995
   17) Use spell check server:              yes
   18) Spell server URL:                    http://mailhost.example.com :7780/aspell.php
   19) Configure for use with mail proxy:   FALSE
   20) Configure for use with web proxy:    FALSE
   21) Enable version update checks:        TRUE
   22) Enable version update notifications: TRUE

   Select, or 'r' for previous menu [r] 4

   Password for admin@mailhost.example.com (min 6 characters): [2LPoBSob] zimbra

10. Type r to return to the Main menu.

11. If you want to change the default Class of Service settings for new features that are listed here, type 9 for Default Class of Service Configuration. Then type the number for the feature to be enabled or disabled. Changes you make here are reflected in the default COS configuration.
12. If no other defaults need to be changed, type a to apply the configuration changes. Press Enter.

13. When Save Configuration data to file appears, type Yes and press Enter.

14. The next request asks where to save the files. To accept the default, press Enter. To save the files to another directory, enter the directory and then press Enter.

15. When The system will be modified - continue? appears, type Yes and press Enter.

The server is modified. Installing all the components and configuring the server can take several minutes. Components that are installed include spam training and documents (wiki) accounts, time zone preferences, backup schedules, as well as common zimlets.
When Configuration complete - press return to exit displays, press Enter.

Verify Zimbra Server Operation

When Configuration complete! appears, the installation is finished and the server has been started.

To verify that the server is running:

1. Type su - zimbra.
2. Type `zmcontrol status`. The services status information is displayed. All services should be running.

```
[zmbræ@example ~]$ zmcontrol status
Host example.com
    antispam            Running
    antivirus           Running
    convertd           Running
    ldap                Running
    logger              Running
    mailbox            Running
    mta                 Running
    snmp                Running
    spell               Running
    stats              Running
[zmbræ@example ~]$
```

**Note:** If services are not running, type `zmcontrol start`.

See the ZCS Administration Guide, Appendix A: Command-Line Utilities for more `zmcontrol` commands.

The installation is complete and the servers are started. You can start adding accounts.

**Final Set-Up**

After the Zimbra servers are configured, the following functions must be configured.

**Important:** Depending on your operating system, the steps below may not be correct. See your operating system documentation for specific information about how to enable syslog.

- If logger is installed, set up the syslog configuration files to enable server statistics to display on the administration console, and enable the logger monitor host. The server statistics includes information about the message count, message volume, and anti-spam and anti-virus activity.

- ZCS ships a default zimbra user with a disabled password. ZCS requires access to this account via ssh public key authentication. On most operating systems this combination is okay, but if you have modified pam rules to disallow any ssh access to disabled accounts then you must define a password for the zimbra UNIX account. This will allow ssh key authentication for checking remote queues. See the Zimbra wiki article, Mail Queue Monitoring.

Set up the ssh keys. To populate the ssh keys, as Zimbra user (su-zimbra). Type `zmupdateauthkeys` and press Enter. The key is updated on `/opt/zimbra/.ssh/authorized_keys`. 
Enabling Server Statistics Display. In order for the server statistics to display on the administration console, the syslog configuration files must be modified.

1. As root, type `/opt/zimbra/libexec/zmsyslogsetup`. This enables the server to display statistics.

2. You must enable syslog to log statistics from remote machines.
   a. Edit the `/etc/sysconfig/syslog` file, add `-r` to the SYSLOGD_OPTIONS setting, `SYSLOGD_options="-r -m 0"`
   b. Stop the syslog daemon. Type `/etc/init.d/syslog stop`
   c. Start the syslog daemon. Type `/etc/init.d/syslog start`

**Note:** On DEBIAN AND UBUNTU, step 2 is as follows

   a. Edit the `/etc/default/syslogd` file, add `-r` to the SYSLOGD_OPTIONS setting, `SYSLOGD_options="-r -m 0"`
   b. Stop the syslog daemon. Type `/etc/init.d/sysklogd stop`
   c. Start the syslog daemon. Type `/etc/init.d/sysklogd start`

### Provisioning Accounts

Once the mailbox server is running, open your browser, enter the administration console URL and log on to the console to provision email accounts. The administration console URL is entered as:

https://[mailhost.example.com]:7071

**Note:** To go to the administration console, you must type https, even if you configured the Web server mode as HTTP.

The first time you log on, a warning may be displayed stating the connection is untrusted. This only applies the first time you log in. Click I understand the Risks to be able to connect to the Zimbra administration console. Then click OK.

Enter the admin user name and password configured during the installation process. Enter the name as admin@mailhost.example.com.

To provision accounts:

You can configure one account at a time with the New Account Wizard or you can create many accounts at once using the Account Migration Wizard.

### Configuring One Account

The administration console New Account Wizard steps you through the account information to be completed.
1. From the administration console Navigation pane, click Accounts.

   **Note:** Four accounts are listed: admin account, two spam training accounts, and a global Documents account. These accounts do not need any additional configuration.

2. Click New. The first page of the New Account Wizard opens.

3. Enter the account name to be used as the email address and the last name. This the only required information to create an account.

4. You can click Finish at this point, and the account is configured with the default COS and global features.

   To configure aliases, forwarding addresses, and specific features for this account, proceed through the dialog before you click Finish.

When the accounts are provisioned, you can send and receive emails.

**Configuring Many Accounts at Once**

You can provision multiple accounts at once using the Account Migration tool from the administration console. The wizard guides you through the steps to import accounts from an external directory server, either Active Directory or an LDAP server. The wizard downloads account information from your directory and creates the accounts in ZCS.

Refer to the administration guide to learn more about provisioning accounts.

**Importing Content from User Mailboxes**

Zimbra developed different applications to facilitate moving a user’s email messages, calendars, and contacts from their old email servers to their accounts on the Zimbra server. When the user’s files are imported, the folder hierarchy is maintained. Use one of the ZCS utilities to move user mail to ZCS to guarantee that all information is imported correctly.

The following applications can be accessed from the administration console Download page, and instruction guides are available from the Help Desk page or from the Zimbra Website, Documents page.

Alternatively, you can download the following applications from http://{example.com/downloads}/index.html (with “example” being your Zimbra server name).

- **Zimbra Migration Wizard for Microsoft Exchange.** Format is an .exe file. You can migrate users from Microsoft® Exchange server email accounts to Zimbra server accounts.
Zimbra Collaboration Server Single Server Installation

- **Zimbra Migration Wizard for IBM Lotus Domino.** Format is an .exe file. You can migrate users from Lotus Domino server email accounts to Zimbra server accounts.

- **Zimbra Migration Wizard for Microsoft Outlook.** Format is an .exe file. Users download the Import Wizard to their computers and run the executable file to import their Outlook .pst files to the Zimbra server. Before users run this utility, Zimbra recommends that they run the Outlook Inbox Repair tool, scanpst.exe, on their .pst files, to clean up any errors in their file. For more information about this tool, go to http://support.microsoft.com/kb/287497.

**Administrators Account**

Initial administrative tasks when you log on for the first time may include setting up the admin mailbox to include features, aliases, and forwarding addresses needed for the administrator’s working environment.

Two aliases for the admin account are created during install:

- **Postmaster.** The postmaster address is displayed in emails that are automatically generated from Postfix when messages cannot be sent. If users reply to this address, the message is forwarded to the admin mailbox.

- **Root.** This address is where notification messages from the operating system are sent.

If you entered a notification address for AV alerts when you configured the MTA, that is different from the default, you need to create that account in the admin console. If you didn’t change the default during installation, the anti-virus notification is sent directly to the admin account.

**Uninstalling Zimbra Collaboration Server**

To uninstall servers, run the install script -u, delete the ZCS directory, and remove the zcs.tgz file on the servers.

1. cd to the original install directory for the zcs files.

2. Type ./install.sh -u

3. When Completely remove existing installation? is displayed, type Yes

   The Zimbra servers are stopped, the existing packages, the webapp directories, and the /opt/zimbra directory are removed

4. Type rm -rf [zcsfullfilename] to delete the ZCS directory

5. Delete the zcs.tgz file
Additional Information

To learn more about the Zimbra Collaboration Server, read the Administrator’s Guide and Help. The Zimbra guides and release notes in .pdf format can be found in the `opt/zimbra/docs` directory and is also available from the administration console Help button and from the Zimbra Website.

- **Administrator’s Guide.** This guide describes product architecture, server functionality, administration tasks, configuration options, and backup and restore procedures. The guide is available in pdf format from the administrator’s console, and in HTML format on the Zimbra Website.

- **Administrator Help.** The administrator Help provides detailed instructions about how to add and maintain your servers, domains, and user accounts from the admin console.

Support and Contact Information

Visit Zimbra’s website to join the community and to be a part of building the best open source messaging solution. We appreciate your feedback and suggestions.

- Contact sales@zimbra.com to purchase the Zimbra Collaboration Server.
- Network Edition customers can contact support at support@zimbra.com.
- Explore the Zimbra Forums for answers to installation or configuration problems.
- Join the Zimbra Community Forums to participate and learn more about the Zimbra Collaboration Server.
- Send an email to feedback@zimbra.com to let us know what you like about the product and what you would like to see in the product. Or, if you prefer, post your ideas to the Zimbra Forums.

If you encounter problems with this software, visit www.zimbra.com and submit a bug report. Make sure you provide enough detail so that the bug can be easily duplicated.
System Requirements for Zimbra Collaboration Server 7.2

This document contains Zimbra Collaboration Server system requirements and available language information for both the Network Edition and the Open Source Edition.

System Requirements

<table>
<thead>
<tr>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Servers</strong></td>
</tr>
<tr>
<td>Evaluation and Testing</td>
</tr>
<tr>
<td>• Intel/AMD 32-bit or 64-bit CPU 1.5 GHz</td>
</tr>
<tr>
<td>• 1 GB RAM</td>
</tr>
<tr>
<td>• 5 GB free disk space for software and logs</td>
</tr>
<tr>
<td>• Temp file space for installs and upgrades*</td>
</tr>
<tr>
<td>• Additional disk space for mail storage</td>
</tr>
<tr>
<td>Production environments</td>
</tr>
<tr>
<td>• Minimum - 32-bit OS with Intel/AMD 2.0 GHZ+ CPU</td>
</tr>
<tr>
<td>Recommended - 64-bit OS</td>
</tr>
<tr>
<td>• Minimum - 2 GB RAM</td>
</tr>
<tr>
<td>Recommend minimum - 4 GB RAM</td>
</tr>
<tr>
<td>• Temp file space for installs and upgrades*</td>
</tr>
<tr>
<td>• 10 GB free disk space for software and logs (SATA or SCSI for performance, and RAID/Mirroring for redundancy)</td>
</tr>
<tr>
<td>• Additional disk space for mail storage</td>
</tr>
</tbody>
</table>

*Temp files space- The zimbra-store requires 5GB for /opt/zimbra, plus additional space for mail storage. The other nodes require 100MB.

General Requirements

• Firewall Configuration should be set to "No firewall", and the Security Enhanced Linux (SELinux) should be disabled

• RAID-5 is not recommended for installations with more than 100 accounts.
### Operating System

**Network Edition**

The following operating systems are supported:

- Red Hat® Enterprise Linux®, AS/ES 6 (64-bit) requires RHEL6 6.1 or later.
- Red Hat® Enterprise Linux®, AS/ES 5 (32-bit or 64-bit)
- Red Hat® Enterprise Linux®, AS/ES 4 (32-bit or 64-bit)

**Note:** The 7.x series of ZCS will be the last release supported with RHEL4 (32-bit and 64-bit), and RHEL5 (32-bit and 64-bit).

**Note:** ZCS 7.2 will be the last supported release of Zimbra Clustering with RHEL/RHCS and Veritas™ Clustering. Cluster feature with RHCS is only available on RHEL 4 with Update 5 or RHEL 5 with Update 4.

- SUSE Linux Enterprise Server 11, SP1 (64-bit)
- SUSE Linux Enterprise Server 10 (32-bit or 64-bit)

**Note:** Cluster feature is not available on SUSE Linux versions.

**Note:** The 7.x series of ZCS will be the last release supported with SLES10 (32-bit and 64-bit). Based on this expectation, we suggest that new SUSE systems use SLES11 SP1 (64-bit).

- Ubuntu 10.04 LTS Server Edition (64-bit)
- Ubuntu 8.04 LTS Server Edition (32-bit or 64-bit)

**Note:** Cluster feature is not available on Ubuntu Linux versions.

**Note:** The 7.x series of ZCS will be the last release supported with Ubuntu 8.04 (32-bit and 64-bit). Based on this expectation, we suggest that new Ubuntu systems use Ubuntu 10.04 (64-bit).

### Operating System

**Open Source Edition**

In addition to supporting the operating systems listed above for the Network Edition, other operating system versions are available for the Open Source Edition. Check the Zimbra Open Source Downloads page on www.zimbra.com.

### File Systems

- **ext3** file system for Linux deployments
### System Requirements

#### Other Dependencies

Netcat (nc) is required on all operating systems using ZCS. The `nc` utility must be installed prior to installation or upgrading.

For SUSE, Ubuntu, and Debian systems, disable AppArmor and verify services that are running before installing ZCS.

For Red Hat Enterprise, Fedora Core and SUSE operating systems, the server must also have the following installed:

- **NPTL**. Native POSIX Thread Library
- **Sudo**. Superuser, required to delegate admins.
- **libidn**. For internationalizing domain names in applications (IDNA)
- **GMP**. GNU Multiple-Precision Library.

For Ubuntu 8.04 LTS or Ubuntu 10.04 LTS, and Debian 5:

- Sudo
- libidn11
- libpcre3
- libexpat1
- libgmp3c2

Note: Ubuntu 8 (64-bit) requires libperl5.8, Debian 5 and Ubuntu 10 (64-bit) require libperl5.10

#### Miscellaneous

- SSH client software to transfer and install the Zimbra Collaboration Server software.
- Valid DNS configured with an A record and MX record
- Servers should be configured to run Network Time Protocol (NTP) on a scheduled basis
The following operating system/browser combinations are supported:

Windows 2000, XP, Vista, and Windows 7 with one of the following:
- Internet Explorer 7 and later
- The latest stable release of:
  - Firefox
  - Safari
  - Google Chrome

Mac OS X 10.4, 10.5 or 10.6 with one of the following:
- The latest stable release of:
  - Firefox
  - Safari
  - Google Chrome

Linux (Red Hat, Ubuntu, Debian, Fedora, or SUSE) with one of the following:
- The latest stable release of:
  - Firefox
  - Google Chrome
### End User Computers using Zimbra Web Client

<table>
<thead>
<tr>
<th>Minimum</th>
<th>Recommended</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Intel/AMD/Power PC CPU 750MHz</td>
<td>• Intel/AMD/Power PC CPU 1.5GHz</td>
</tr>
<tr>
<td>• 256MB RAM</td>
<td>• 512MB RAM</td>
</tr>
</tbody>
</table>

**Note:** Other configurations may work.

**For Zimbra Web Client - Advanced version:**

The following operating system/browser combinations for the advanced Zimbra Web Client are supported:

- Windows 2000, XP SP 3, Vista SP 2, or Windows 7 with one of the following:
  - Internet Explorer 7 and later
  - The latest stable release of:
    - Firefox
    - Safari
    - Google Chrome

- Mac OS X 10.4, 10.5, or 10.6 with one of the following:
  - The latest stable release of:
    - Firefox
    - Safari
    - Google Chrome

- Linux (Red Hat, Ubuntu, Debian, Fedora, or SUSE) with one of the following:
  - The latest stable release of:
    - Firefox
    - Google Chrome
End User Computers using Zimbra Web Client (continued)

</tbody>
</table>

Operating system POP/IMAP combinations

- Windows XP SP 3, Vista SP 2, Windows 7 with Outlook Express 6, Outlook 2003, (MAPI), Thunderbird
- Fedora Core 4 or later with Thunderbird
- Mac OS X 10.4 or later with Apple Mail

### Accessibility and Screen Readers

Zimbra recommends that customers requiring use of screen readers for accessibility leverage the use of the Standard Zimbra Web Client (HTML).

Zimbra continues to invest in improving the accessibility of this interface.

**Recommendation - If users are presently using IE 6, Zimbra strongly recommends that they upgrade to the latest version of Internet Explorer for optimal performance with ZWC.**

### Mobile OS support for Zimbra MobileSync

The following are Mobile OS support for Zimbra MobileSync:

- iOS 4.0 and later
- Android 2.0 and later
- Windows Mobile 6.0 and later

### Monitor

Display minimum resolution 1024 x 768

### Internet Connection Speed

128 kbps or higher
## Available Languages
